

Energy storage power station frequency regulation income

Which energy storage power station should provide frequency regulation service?

It can be seen from the figure that the energy storage power station with stronger frequency regulation response ability will be preferentially called to provide frequency regulation service.

Can energy storage power station be strategic charged?

In the 1-4 and 14-15 periods, the energy storage power station can be strategic charged to supplement the electricity consumed by its own discharge so that it can fully participate in the frequency modulation market and obtain the frequency modulation income.

What is the frequency regulation system of a regional power grid?

The frequency regulation system of the regional power grid equipped with energy storage comprises dispatching agencies, conventional thermal power units, battery energy storage systems, power conversion systems (PCS), transformers and power distribution, main power grids, and electrical protection systems.

What is the frequency modulation strategy for energy storage power stations?

Under the strategy in this paper, the energy storage power station undertakes more frequency modulation tasks, and the frequency modulation capacity provided by the system accounts for 81.56% of the total frequency modulation capacity demand, and the frequency modulation mileage accounts for 95.88% of the total demand.

What is the charge and discharge efficiency of energy storage station?

The charge and discharge efficiency is 90%, and the maximum and minimum allowable power are 90% and 10% of the energy storage capacity, respectively. The daily load curve of the power system in which the energy storage station participates in the ancillary service is shown in Fig. 3.

What is the life cycle cost of energy storage power station?

The Life Cycle Cost (LCC) of energy storage power station mainly includes investment cost C_{inv} and operation cost. The operation cost of energy storage generally includes operation and maintenance cost COM , scrap processing cost C_{scr} , power shortage penalty cost C_p and power loss cost C_l . Therefore, the required energy storage LCC model $CLCC$ is
