

Export requirements for energy storage lithium batteries

What are the shipping requirements for lithium metal batteries?

For lithium metal batteries, the following shipping requirements apply: A lithium metal battery handling label and safety document is required for packages containing >4 cells or >2 batteries. Air service may not be eligible. Please see U.S. DOT Hazardous Materials Regulations for further details.

What are the new packaging requirements for lithium ion batteries?

Revised Packing Instructions: More stringent requirements for UN-certified packaging, capable of withstanding specific drop tests. State of Charge (SoC) Emphasis: Increased scrutiny on the SoC for standalone lithium-ion battery shipments, with a general requirement not to exceed 30% of rated capacity.

How should a lithium battery container be segregated?

This allows for crew access for boundary cooling with fire hoses and permits flammable gases to vent to the atmosphere. Segregation: It is recommended to segregate lithium battery containers from those containing other dangerous goods, particularly flammables, by at least one container bay (6 meters).

What are the risks associated with the carriage of lithium-ion batteries?

The primary risk associated with the carriage of lithium-ion batteries is thermal runaway. This is a chemical reaction in which an increase in temperature within a battery cell causes a further, uncontrolled increase in temperature. This process can be initiated by manufacturing defects, physical damage, or overcharging. The consequences include:

How to secure a lithium battery container?

Segregation: It is recommended to segregate lithium battery containers from those containing other dangerous goods, particularly flammables, by at least one container bay (6 meters). Securing: All cargo must be secured within its container and on the vessel in accordance with the CTU Code and the vessel's Cargo Securing Manual.

Should EV batteries be shipped at a low SoC?

State of Charge (SoC): Strongly advocates for shipping batteries at a low SoC (ideally 30%-50%) to reduce energy available for a thermal event. The growing EV market has necessitated a dedicated regulatory framework and industry best practices. Vehicles must be securely stowed to prevent movement.
