

What is a wind turbine digital twin?

Digital twins offer a smarter alternative through predictive maintenance. Using real-time data from sensors installed on turbines, a wind turbine digital twin detects anomalies such as vibrations, excessive temperatures, or irregular energy outputs. These indicators help identify early signs of component failure, such as:

What is a digital twin for wind farm flow system?

The first digital twin for wind farm flow system is developed. The digital twin integrates the Lidar measurements and the flow physics seamlessly. The method is developed based on physics-informed neural networks. A set of high-fidelity simulations are carried out for evaluation of the digital twin.

Can digital twin technology be used in wind energy systems?

This paper contributes to the understanding and development of digital twin technology within wind energy systems through a comprehensive literature review. A systematic approach is used in the review, beginning with the formulation of the research question and establishment of the review protocol.

Can a digital twin be used for a floating wind turbine?

When comparing the digital twin estimations with the measurements from the TetraSpar prototype, the errors increased to 10 %-15 % on average for the quantities of interest. Over-all, the accuracy of the results appeared promising given the scope of our work, which aimed to illustrate a proof of concept for a floating wind turbine digital twin.

How do digital twin wind turbines reduce downtime?

For instance, GE Renewable Energy integrates digital twins across its wind farms to minimize downtime. By predicting component wear and scheduling maintenance during optimal weather windows, GE ensures turbines achieve peak uptime while avoiding disruptions through their digital twin wind turbines.

Can a predictive digital twin platform be used for wind energy systems?

In predictive digital twin platforms for wind energy systems, sophisticated models introduce significant computational challenges. High-fidelity models can capture complex interactions and nonlinear behavior within and between wind turbines, but they demand substantial computational resources for large scale simulations.

In the fast-evolving renewable energy sector, offshore wind technology has made significant strides, evolving from bottom-fixed turbines to the integration of floating turbines.

Wind turbines typically need to operate for extended periods without failure to ensure consistent power generation. Thus, developing an ...

Wind power digital system

A first digital twin for wind farm flow system is developed in this work, which can serve as the backbone of the next-generation wind technology throughout the lifecycle of wind ...

Keywords: digital twin models, predictive maintenance, offshore wind energy, fault detection, machine learning applications, renewable energy systems, wind turbine ...

Enter digital twin technology, an innovative solution reshaping the design, operation, and maintenance of wind turbines and offshore wind farms. Digital twins create real-time virtual ...

When it comes to wind energy systems, digital twins can showcase individual turbine components, the entire turbine, or even the complete wind farms. These models ...

To identify the key features and technologies that enhance real-time wind energy systems through predictive digital twins, a comprehensive literature review was conducted, ...

This report analyses the status of digitalisation of the wind energy sector today and presents WindEurope's vision on the evolution of digital applications and technologies towards 2030. ...

The latter is realized through online monitoring based on computationally inexpensive digital twin (DT) models and the subsequent dynamic optimization of the turbine ...

Digital twins (DTs) have been implemented in various applications, including wind turbine generators (WTGs). They are used to create virtual replicas of physical turbines, which ...

The article first introduces the origin and definition of digital win technology and gives the five-dimensional model of the digital twin. Then, it focuses on the technical ...

This paper presents a probabilistic framework for updating the structural reliability of offshore wind turbine substructures based on digital twin information. In particular, the ...

The digital twin model diagnoses faults and constantly revises the model based on the diagnostic results. The digital twin fault diagnosis system was implemented in the Unity3D ...

The massive sensor rollout and increase in big data processing capacity over the last decade has made data collection and analysis more efficient, allowing for the development ...

The digital twins create value in every phase of the life cycle of a wind turbine - design, operation and maintenance, and in its potentially ...

Then, it focuses on the technical realization of the offshore wind power digital twin system, including the five-dimensional model of the offshore wind power digital twin system.
